

Release Agent

Superior Mold Release & Antiquing Agent

- Colored or Plain
- Spread uniformity
- Uniform Coloring
- Custom Colour Range

COLORCRETE RELEASE AGENT

DESCRIPTION

- Coloredcrete Release Agent is a pigmented or plain product used for decorative concrete molding or stamp concrete.

USE

- Coloredcrete Release Agent is used as concrete mold release which prevents the adhesion of freshly placed cement or color hardener to stamp pattern.
- It's also used as antiquing agent for stamp concrete product.
- Coloredcrete Release Agent comes in variety of colors (Please see color chart for your reference).

APPLICATION

- Coloredcrete Release Agent is broadcasted over the substrate (colored concrete or plain concrete) to provide barrier between the product and the stamp or mold, without such barrier in place stamp molding would not be possible.
- Coloredcrete release agent comes in several colors which can lean marks on the substrate (if texture pattern is used) and create an antiquing effect on the substrate after washing and sealing.
- Coloredcrete release agent must be applied in thin coats over substrate (proper timing must be observed to prevent mixing of the release agent and substrate).
- Release agent can be broadcasted over the substrate soon after concrete application and color hardener, prior to molding the surface.
- Coloredcrete release agent then can be washed after 48 hours using detergents and nylon brush or foam depending to the required color, prior to application of sealer.

Coverage: One 10 kg bag should cover approximately 90-100m

Note: Release Agent does not contain cement.
